

2009 Drinking Water Consumer Confidence Report

Water System Name: Town of Scotia Report Date: September 2012 We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our

monitoring for the period of January 1 - December 31, 2009.

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Type of water source(s) in use: Surface Water						
Name & location of source	(s): Eel River infiltration	gallery, Scotia California				
Drinking Water Source Assessment information:	Drinking Water Source Assessment/Vulnerability Assessment was conducted in January 2003 by California Public Health, Klamath District. Copy of the assessment is on file at CDPH Klamath District, 364 Knollcre Suite 1, Redding, CA 96002 and Town of Scotia Company, LLC, office at 113 Main Street, Scotia, CA 95					
Time and place of regularly scheduled board meetings for public participation:		rict (SCSD) has recently formed and approved by LAFCO to take over ownership f Scotia water system. SCSD holds monthly meetings to discuss the transition process nsibility for the system.				
	in the Town of Scotia, at 113 M	address the Town of Scotia Company, LLC Water Company through the main office ain Street, Suite A, Scotia, CA 95565. Public may attend the monthly board meetings hursdays of each month at 120 Main Street, Scotia, CA 95565.				
	Scotia CSD :	http:\scotiacsd.com				
	Town of Scotia, LLC : http://townofscotia.com					

### TERMS USED IN THIS REPORT

<ul> <li>Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.</li> <li>Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).</li> </ul>	<ul> <li>Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.</li> <li>Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.</li> <li>Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.</li> </ul>
<b>Public Health Goal (PHG)</b> : The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.	<b>Regulatory Action Level (AL)</b> : The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.
<b>Maximum Residual Disinfectant Level (MRDL)</b> : The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.	Variances and Exemptions: Department permission to exceed an MCL or not comply with a treatment technique under certain conditions.
	ND: not detectable at testing limit
Maximum Residual Disinfectant Level Goal (MRDLG): The level of a	ppm: parts per million or milligrams per liter (mg/L)
drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.	ppb: parts per billion or micrograms per liter (ug/L)
	ppt: parts per trillion or nanograms per liter (ng/L)
	<b>ppq</b> : parts per quadrillion or picogram per liter (pg/L)
	pCi/L: picocuries per liter (a measure of radiation)

## Town of Scotia's Drinking Water is from the Eel River

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

## Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic
  wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum
  production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the state Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The Department allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

Microbiological Contaminants (complete if bacteria detected)	Highest No. of Detections	No. of months in violation	MCL	MCLG	Typical Source of Bacteria
Total Coliform Bacteria	(In a mo.) <u>0</u>	0	More than 1 sample in a month with a detection	0	Naturally present in the environment
Fecal Coliform or E. coli	(In the year) <u>0</u>	0	A routine sample and a repeat sample detect total coliform and either sample also detects fecal coliform or <i>E. coli</i>	0	Human and animal fecal waste

## TABLE 2 - SAMPLING RESULTS SHOWING THE DETECTION OF LEAD AND COPPER

Lead and Copper (complete if lead or copper detected in the last sample set)	No. of samples collected	90 <sup>th</sup> percentile level detected	No. sites exceeding AL	AL	PHG	Typical Source of Contaminant
Lead (ppb)	10	13	0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits
Copper (ppm)	10	0.37	0	1.3	0.3	Internal corrosion of household plumbing systems; erosion of natural deposits;

	leaching from wood preservatives

	TABLE	3 – SAMPL	ING RESULTS	FOR SODIU	M AND HAI	RDNESS
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of <b>Detections</b>	MCL	PHG (MCLG)	Typical Source of Contaminant
Sodium (ppm)	3/26/2006	5.0 mg/L	5.0 mg/L	none	none	Salt present in the water and is generally naturally occurring
Hardness (ppm)	3/26/2006	82.0 mg/l	81.0 mg/L	none	none	Sum of polyvalent cations present in the water, generally magnesium and calcium. and are usually naturally occurring

\*Any violation of an MCL or AL is asterisked. Additional information regarding the violation is provided later in this report.

# TABLE 4 – DETECTION OF CONTAMINANTS WITH A PRIMARY DRINKING WATER STANDARD

Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant
Aluminum (ug/l)	4/10/2008	21	21	1000	n/a	Erosion of natural deposits
Barium (ug/l)	4/10/2008	120	120	1000	n/a	Erosion of natural deposits
Chromium (ug/l)	4/10/2008	4.6	4.6	50	2.5	Erosion of natural deposits
Nickel (ug/l)	4/10/2008	2.1	2.1	100	100	Erosion of natural deposits
TTHMs (Total Trihalomethanes) (ppb)	2011 (ave) 2004	12.5		80	n/a	By-product of drinking water disinfection
HAA5 (Haloacetic Acids) (ppb)	2011 (ave) 2004	7.3 2.7		60	n/a	Byproduct of drinking water disinfection

\*Any violation of an MCL or AL is asterisked. Additional information regarding the violation is provided later in this report.

# TABLE 5 - DETECTION OF CONTAMINANTS WITH A SECONDARY DRINKING WATER STANDARD

Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Iron (ug/l)	3/27/2007	250		300	n/a	Leaching from natural deposits Industrial wastes
Manganese (ug/l)	3/27/2007	62		50	n/a	Leaching from natural deposits
Chloride (mg/l)	3/27/2007	8.4		500	n/a	Runoff/leaching from natural deposits
Sulfate (mg/l)	3/27/2007	10		500		Runoff/leaching from natural deposits

\*Any violation of an MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

## Additional General Information on Drinking Water

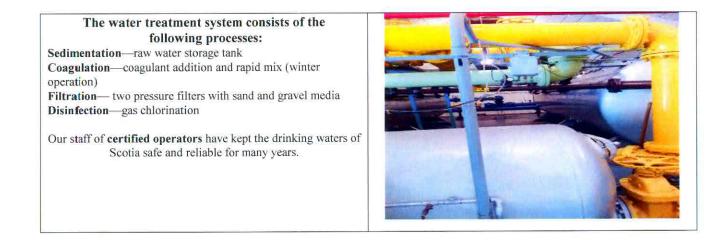

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

## Summary Information for Violation of a MCL, MRDL, AL, TT, or Monitoring and Reporting Requirement

Violation	Explanation	Duration	Actions Taken to Correct the Violation	Health Effects Language
Monitoring Requirements not met for total number of coliform samples for the months of January and July, 2009	We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During January and again in July, only one sample was taken in each month and two are required.	January and July.	All required samples have been taken during the follow- up months. NO samples tested positive during 2009.	Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria may be present.

The Town of Scotia drinking water treatment system was constructed in 1966 and is well maintained and in good condition. Water from the intake gallery in the Eel River is pumped to a 1.0- million gallon (MG) raw water storage tank by domestic booster pumps. Before discharging to the tank, the water is piped through the WTF where a flocculent is added prior to an in-line mixer. The water flows through the mixer, up to the 1.0-MG tank. The 1.0-MG tank, which also serves as a sedimentation tank, feeds a pressure filter system at the WTF. Filtered water is disinfected and then flows to the 0.488-MG finish water storage tank. The treatment system does not require any internal pumps, operating on pressure supplied by the upper 1.0-MG tank.

## For Systems Providing Surface Water as a Source of Drinking Water

## TABLE 6 - SAMPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES

Treatment Technique <sup>(a)</sup> (Type of approved filtration technology used)	Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration—pressure filters Disinfection—gas chlorination
Turbidity Performance Standards <sup>(b)</sup> (that must be met through the water treatment process)	<ul> <li>Turbidity of the filtered water must:</li> <li>1 - Be less than or equal to _0.5 NTU in 95% of measurements in a month.</li> <li>2 - Not exceed _1 NTU for more than eight consecutive hours.</li> <li>3 - Not exceed 5_ NTU at any time.</li> </ul>
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%
Highest single turbidity measurement during the year	1.011
Number of violations of any surface water treatment requirements	None

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

\* Any violation of a TT is marked with an asterisk.

2010 Drinking Water Consumer Confidence Report

## Town of Scotia's Drinking Water is from the Eel River

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

#### Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- · Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the state Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The Department allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

Chloride (mg/l)	3/27/2007	8.4		500	n/a	Runoff/leaching from natural deposits
Sulfate (mg/l)	3/27/2007	10		500		Runoff/leaching from natural deposits

\*Any violation of an MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

## Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

The Town of Scotia drinking water treatment system was constructed in 1966 and is well maintained and in good condition. Water from the intake gallery in the Eel River is pumped to a 1.0- million gallon (MG) raw water storage tank by domestic booster pumps. Before discharging to the tank, the water is piped through the WTF where a flocculent is added prior to an in-line mixer. The water flows through the mixer, up to the 1.0-MG tank. The 1.0-MG tank, which also serves as a sedimentation tank, feeds a pressure filter system at the WTF. Filtered water is disinfected and then flows to the 0.488-MG finish water storage tank. The treatment system does not require any internal pumps, operating on pressure supplied by the upper 1.0-MG tank.

The water treatment system consists of the following processes: Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration— two pressure filters with sand and gravel media Disinfection—gas chlorination

Our staff of **certified operators** have kept the drinking waters of Scotia safe and reliable for many years.

## For Systems Providing Surface Water as a Source of Drinking Water

	MINIC DECLUTE CHOWING THEATMENT OF SUBFACE WATER SOUDCES
TABLE 6 -	MPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES

Treatment Technique <sup>(a)</sup> (Type of approved filtration technology used)	Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration—pressure filters Disinfection—gas chlorination
Turbidity Performance Standards <sup>(b)</sup> (that must be met through the water treatment process)	Turbidity of the filtered water must: 1 – Be less than or equal to _0.5 NTU in 95% of measurements in a month. 2 – Not exceed _1 NTU for more than eight consecutive hours. 3 – Not exceed 5 NTU at any time.
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%
Highest single turbidity measurement during the year	1.011
Number of violations of any surface water treatment requirements	None

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

\* Any violation of a TT is marked with an asterisk.

Water System Name: Town of Scotia Report Date: July 2012

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2011.

## Town of Scotia's Drinking Water is from the Eel River

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

#### Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- · Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum
  production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- · Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the state Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The Department allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

Fecal Coliform or <i>E. coli</i>	(In the year) <u>0</u>	0	A routine sample and a repeat sample detect total coliform and either sample also detects fecal coliform or <i>E. coli</i>	0	Human and animal fecal waste

#### TABLE 2 - SAMPLING RESULTS SHOWING THE DETECTION OF LEAD AND COPPER

Lead and Copper (complete if lead or copper detected in the last sample set)	No. of samples collected	90 <sup>th</sup> percentile level detected	No. sites exceeding AL	AL	PHG	Typical Source of Contaminant
Lead (ppb)	10	13	0	15	0.2	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits
Copper (ppm)	10	0.37	0	1.3	0.3	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives

Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Sodium (ppm)	3/26/2006	5mg/l	5mg/l	none	none	Salt present in the water and is generally naturally occurring
Hardness (ppm)	3/26/2006	5mg/l	82mg/l	none	none	Sum of polyvalent cations present in the water, generally magnesium and calcium, and are usually naturally occurring

## TABLE 4 – DETECTION OF CONTAMINANTS WITH A PRIMARY DRINKING WATER STANDARD

Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL [MRDL]	PHG (MCLG) [MRDLG]	Typical Source of Contaminant
Aluminum (ug/l)	4/10/2008	21	21	1000	n/a	Erosion of natural deposits
Barium (ug/l)	4/10/2008	120	120	1000	n/a	Erosion of natural deposits
Chromium (ug/l)	4/10/2008	4.6	4.6	50	2.5	Erosion of natural deposits
Nickel (ug/l)	4/10/2008	2.1	2.1	100	100	Erosion of natural deposits
TTHMs (Total Trihalomethanes) (ppb)	2011 (ave)	12.5		80	n/a	By-product of drinking water disinfection
HAA5 (Haloacetic Acids) (ppb)	2011 (ave)	7.3		60	n/a	Byproduct of drinking water disinfection

\*Any violation of an MCL or AL is asterisked. Additional information regarding the violation is provided later in this report.

# TABLE 5 - DETECTION OF CONTAMINANTS WITH A SECONDARY DRINKING WATER STANDARD

Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	MCL	PHG (MCLG)	Typical Source of Contaminant
Iron (ug/l)	3/27/2007	250	250-250	300	n/a	Leaching from natural deposits Industrial wastes
Manganese (ug/l)	3/27/2007	62	62-62	50	n/a	Leaching from natural deposits
Chloride (mg/l)	3/27/2007	8.4	8.4-8.4	500	n/a	Runoff/leaching from natural deposits
Specific Conductance	6/17/2010	210	210-210	2200	n/a	Substances that form ions when in water seawater influence
Sulfate (mg/l)	3/27/2007	10	10-10	500	n/a	Runoff/leaching from natural deposits

\*Any violation of an MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

#### Page 4 of 4

### Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

The Town of Scotia drinking water treatment system was constructed in 1966 and is well maintained and in good condition. Water from the intake gallery in the Eel River is pumped to a 1.0- million gallon (MG) raw water storage tank by domestic booster pumps. Before discharging to the tank, the water is piped through the WTF where a flocculent is added prior to an in-line mixer. The water flows through the mixer, up to the 1.0-MG tank. The 1.0-MG tank, which also serves as a sedimentation tank, feeds a pressure filter system at the WTF. Filtered water is disinfected and then flows to the 0.488-MG finish water storage tank. The treatment system does not require any internal pumps, operating on pressure supplied by the upper 1.0-MG tank.

The water treatment system consists of the following processes: Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration— two pressure filters with sand and gravel media Disinfection—gas chlorination

Our staff of **certified operators** have kept the drinking waters of Scotia safe and reliable for many years.

#### For Systems Providing Surface Water as a Source of Drinking Water

TABLE 6 - SAMPLING RESULTS SHOW	ING TREATMENT OF SURFACE WATER SOURCES				
Treatment Technique <sup>(a)</sup> (Type of approved filtration technology used)	Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration—pressure filters Disinfection—gas chlorination				
	Turbidity of the filtered water must:				
Turbidity Performance Standards (b)	$1 - Be$ less than or equal to $_0.5$ NTU in 95% of measurements in a month.				
(that must be met through the water treatment process)	2 - Not exceed _1 NTU for more than eight consecutive hour				
	3 – Not exceed 5_NTU at any time.				
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%				
Highest single turbidity measurement during the year	0.607				
Number of violations of any surface water treatment requirements	None				

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

\* Any violation of a TT is marked with an asterisk.

# 2012 Drinking Water Consumer Confidence Report

Water System Name: Town of Scotia

Report Date: July 1, 2013

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2012.

#### Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Secondary MCLs are set to drinking water.	p protect the odor, taste, and appearance of	Secondary Drinking Water Standards (SDWS): MCLs for contaminants that					

**Maximum Contaminant Level Goal (MCLG)**: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

**Public Health Goal (PHG)**: The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

**Maximum Residual Disinfectant Level (MRDL)**: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**Maximum Residual Disinfectant Level Goal (MRDLG)**: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**Secondary Drinking Water Standards (SDWS):** MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

**Treatment Technique (TT):** A required process intended to reduce the level of a contaminant in drinking water.

**Regulatory Action Level (AL)**: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

**Variances and Exemptions**: Department permission to exceed an MCL or not comply with a treatment technique under certain conditions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

**ppb**: parts per billion or micrograms per liter (ug/L)

**ppt**: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

## Town of Scotia's Drinking Water is from the Eel River

**The sources of drinking water** (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

#### Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the state Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The Department allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

	deposits.		at 62 ug/L					

**The Town of Scotia drinking water treatment system** was constructed in 1966 and is well maintained and in good condition. Water from the intake gallery in the Eel River is pumped to a 1.0- million gallon (MG) raw water storage tank by domestic booster pumps. Before discharging to the tank, the water is piped through the WTF where a flocculent is added prior to an in-line mixer. The water flows through the mixer, up to the 1.0-MG tank. The 1.0-MG tank, which also serves as a sedimentation tank, feeds a pressure filter system at the WTF. Filtered water is disinfected and then flows to the 0.488-MG finish water storage tank. The treatment system does not require any internal pumps, operating on pressure supplied by the upper 1.0-MG tank.

## For Systems Providing Surface Water as a Source of Drinking Water

TABLE 6 - SAMPLING RESULTS SHOW	ING TREATMENT OF SURFACE WATER SOURCES
Treatment Technique <sup>(a)</sup> (Type of approved filtration technology used)	Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration—pressure filters Disinfection—gas chlorination
Turbidity Performance Standards <sup>(b)</sup> (that must be met through the water treatment process)	Turbidity of the filtered water must: 1 – Be less than or equal to _0.5 NTU in 95% of measurements in a month. 2 – Not exceed _1 NTU for more than eight consecutive hours. 3 – Not exceed 5_ NTU at any time.
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%
Highest single turbidity measurement during the year	1.12
Number of violations of any surface water treatment requirements	None

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

\* Any violation of a TT is marked with an asterisk.

# Water Conservation Tips for Consumers

Did you know that the average U.S. household uses approximately 400 gallons of water per day or 100 gallons per person per day? Luckily, there are many low-cost and no-cost ways to conserve water. Small changes can make a big difference – try one today and soon it will become second nature.

- Take short showers a 5 minutes shower uses 4 to 5 gallons of water compared to up to 50 gallons for a bath.
- Shut off water while brushing your teeth, washing your hair and shaving and save up to 500 gallons a month.
- Use a water-efficient showerhead. They are inexpensive, easy to install, and can save you up to 750 gallons a month.
- Run your clothes washer and dishwasher only when they are full. You can save up to 1,000 gallons a month.
- Water plants only when necessary.
- Fix leaking toilets and faucets. Faucet washers are inexpensive and take only a few minutes to replace. To check your toilet for a leak, place a few drops of food coloring in the tank and wait. If it seeps into the toilet bowl without flushing, you have a leak. Fixing it or replacing it with a new, more efficient model can save up to 1,000 gallons a month.
- Teach your kids about water conservation to ensure a future generation that uses water wisely. Make it a family effort to reduce next month's water bill!
- Visit <u>www.epa.gov/watersense</u> for more information.

# 2013 Drinking Water Consumer Confidence Report

Water System Name: Town of Scotia Report Date: June 2014

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2013.

	TERMS USED IN THIS REPORT						

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

**Maximum Contaminant Level Goal (MCLG)**: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).

**Public Health Goal (PHG)**: The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

**Maximum Residual Disinfectant Level (MRDL)**: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**Maximum Residual Disinfectant Level Goal (MRDLG)**: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

**Primary Drinking Water Standards (PDWS):** MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

**Secondary Drinking Water Standards (SDWS):** MCLs for contaminants that affect taste, odor, or appearance of the drinking water. Contaminants with SDWSs do not affect the health at the MCL levels.

**Treatment Technique (TT)**: A required process intended to reduce the level of a contaminant in drinking water.

**Regulatory Action Level (AL)**: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.

**Variances and Exemptions**: Department permission to exceed an MCL or not comply with a treatment technique under certain conditions.

ND: not detectable at testing limit

ppm: parts per million or milligrams per liter (mg/L)

**ppb**: parts per billion or micrograms per liter (ug/L)

ppt: parts per trillion or nanograms per liter (ng/L)

ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

**The sources of drinking water** (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

#### Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- *Radioactive contaminants*, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the state Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The Department allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. ## Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

**The Town of Scotia drinking water treatment system** was constructed in 1966 and is well maintained and in good condition. Water from the intake gallery in the Eel River is pumped to a 1.0- million gallon (MG) raw water storage tank by domestic booster pumps. Before discharging to the tank, the water is piped through the WTF where a flocculent is added prior to an in-line mixer. The water flows through the mixer, up to the 1.0-MG tank. The 1.0-MG tank, which also serves as a sedimentation tank, feeds a pressure filter system at the WTF. Filtered water is disinfected and then flows to the 0.488-MG finish water storage tank. The treatment system does not require any internal pumps, operating on pressure supplied by the upper 1.0-MG tank.

The water treatment system consists of the following processes: Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration— two pressure filters with sand and gravel media Disinfection—gas chlorination

Our staff of certified operators have kept the drinking waters of Scotia safe and reliable for many years.

#### For Systems Providing Surface Water as a Source of Drinking Water

TABLE 6 - SAMPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES				
Treatment Technique <sup>(a)</sup> (Type of approved filtration technology used)	Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix (winter operation) Filtration—pressure filters Disinfection—gas chlorination			
Turbidity Performance Standards <sup>(b)</sup> (that must be met through the water treatment process)	<ul> <li>Turbidity of the filtered water must:</li> <li>1 - Be less than or equal to _0.5 NTU in 95% of measurements in a month.</li> <li>2 - Not exceed _1 NTU for more than eight consecutive hours.</li> <li>3 - Not exceed 5_ NTU at any time.</li> </ul>			
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%			
Highest single turbidity measurement during the year	0.219			
Number of violations of any surface water treatment requirements	None			

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

\* Any violation of a TT is marked with an asterisk.

# 2014 Consumer Confidence Report

Water System Name: Town of Scotia

Report Date: September 2015

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 - December 31, 2014 and may include earlier monitoring data.

# Este informe contiene información muy importante sobre su agua potable. Tradúzcalo ó hable con alguien que lo entienda bien.

Type of water source(s) in use: Surface Water	
Name & general location of source(s): <u>Eel Rive</u>	er infiltration galley, Scotia California
Drinking Water Source Assessment information:	The most recent inspection of the public water treatment and distribution system for the Town of Scotia was conducted in November 2013 by the Division of Drinking Water and Environmental Management, Klamath District. A copy of the complete assessment is on file at the State Water Resource Control Board and at the Town of Scotia Co. LLC office, 108 Main Street, Scotia CA 95565, phone (707) 764-5063.

Time and place of regularly scheduled board meetings for public participation: <u>Scotia Community Service District</u> (SCSD) Board holds public meetings the 3<sup>rd</sup> of each month at 5:30pm. Located at 122 Main St Scotia CA 95565.

For more information, contact: Frank Shaw Bacik

Phone: (707)764-4131

## TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary	<b>Primary Drinking Water Standards (PDWS)</b> : MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.			
MCLs are set to protect the odor, taste, and appearance of drinking water.	Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking			
Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no	water. Contaminants with SDWSs do not affect the health at the MCL levels.			
known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency (USEPA).	<b>Treatment Technique (TT)</b> : A required process intended to reduce the level of a contaminant in drinking water.			
<b>Public Health Goal (PHG)</b> : The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.	<b>Regulatory Action Level (AL)</b> : The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.			
<b>Maximum Residual Disinfectant Level (MRDL)</b> : The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant	<b>Variances and Exemptions</b> : State Board permission to exceed an MCL or not comply with a treatment technique under certain conditions.			
is necessary for control of microbial contaminants.	ND: not detectable at testing limit			
Maximum Residual Disinfectant Level Goal (MRDLG):	<b>ppm</b> : parts per million or milligrams per liter (mg/L)			
The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not	<b>ppb</b> : parts per billion or micrograms per liter ( $\mu g/L$ )			

reflect the benefits of the use of disinfectants to control microbial contaminants.

ppt: parts per trillion or nanograms per liter (ng/L)
ppq: parts per quadrillion or picogram per liter (pg/L)

pCi/L: picocuries per liter (a measure of radiation)

**The sources of drinking water** (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

## Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants*, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides*, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- *Organic chemical contaminants*, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- *Radioactive contaminants*, that can be naturally-occurring or be the result of oil and gas production and mining activities.

**In order to ensure that tap water is safe to drink**, the USEPA and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, 7, and 8 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old.

TABLE 1	TABLE 1 – SAMPLING RESULTS SHOWING THE DETECTION OF COLIFORM BACTERIA								
Microbiological Contaminants (complete if bacteria detected)	Highest No. of Detections	No. of months in violation				МС	CL	MCLG	Typical Source of Bacteria
Total Coliform Bacteria	(In a mo.) 0	0		More than 1 month with a	•	0	Naturally present in the environment

# Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Town of Scotia Company, LLC is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <a href="http://www.epa.gov/safewater/lead">http://www.epa.gov/safewater/lead</a>.

# Summary Information for Violation of a MCL, MRDL, AL, TT, or Monitoring and Reporting Requirement

VIOLATIO	VIOLATION OF A MCL, MRDL, AL, TT, OR MONITORING AND REPORTING REQUIREMENT					
Violation	Explanation	Duration	Actions Taken to Correct the Violation	Health Effects Language		
Manganese	Manganese was found at levels that exceed the secondary MCL of 50 µg/L.		None, source is from natural deposits	Secondary drinking water contaminants do not pose health risks at levels typically found in drinking water; however the contaminants can cause offensive taste, odor, color, corrosion, foaming and/or staining problems.		

# For Systems Providing Surface Water as a Source of Drinking Water

TABLE 8 - SAMPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES				
	Sedimentation-raw water storage tank			
Treatment Technique <sup>(a)</sup>	Coagulation-coagulant addition and rapid mix			
(Type of approved filtration technology used)	Filtration-pressure filter			
	Disinfection-gas chlorination			
— (b)	Turbidity of the filtered water must:			
Turbidity Performance Standards <sup>(b)</sup> (that must be met through the water treatment process)	1 - Be less than or equal to 0.3 NTU in 95% of measurements in a month.			
(that must be not an ough the water reachent process)	2 – Not exceed 1 NTU at any time.			
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	93%			
Highest single turbidity measurement during the year	0.351			
Number of violations of any surface water treatment requirements	1			

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

# Town of Scotia's Drinking Water is from the Eel River

# Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language for Community Water Systems: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. <u>Town of Scotia Company, LLC</u> is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. [Optional: If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants.] If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <a href="http://www.epa.gov/lead">http://www.epa.gov/lead</a>.

# Summary Information for Violation of a MCL, MRDL, AL, TT, or Monitoring and Reporting Requirement

VIOLATION OF A MCL, MRDL, AL, TT, OR MONITORING AND REPORTING REQUIREMENT					
Violation	Explanation	Duration	Actions Taken to Correct the Violation	Health Effects Language	
Total Coliform Bacteria	There were two total coliform detections during the month of July 2015.	<1 month	Chlorine dosage was increased.	Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially- harmful, bacteria may be present. Coliforms were found in more samples than allowed and this was a warning of potential problems.	

# For Systems Providing Surface Water as a Source of Drinking Water

TABLE 8 - SAMPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES				
	Sedimentation – raw water storage tank			
Treatment Technique <sup>(a)</sup>	Coagulation – coagulant addition and rapid mix			
(Type of approved filtration technology used)	Filtration – pressure filter			
	Disinfection – gas chlorination*			
	Turbidity of the filtered water must:			
Turbidity Performance Standards <sup>(b)</sup> (that must be met through the water treatment process)	1 – Be less than or equal to _0.3_ NTU in 95% of measurements in a month.			
	2 – Not exceed <u>1</u> NTU for more than eight consecutive hours.			
	3 – Not exceed <u>1</u> NTU at any time.			
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	61%			
Highest single turbidity measurement during the year	0.907			
Number of violations of any surface water treatment requirements	2			

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

\* Any violation of a TT is marked with an asterisk. Additional information regarding the violation is provided below.

# Summary Information for Violation of a Surface Water TT

VIOLATION OF A SURFACE WATER TT							
TT Violation	Explanation	Duration	Actions Taken to Correct the Violation	Health Effects Language			
Disinfection residual	In July 2015, there was a disruption to the water supply system following a wood waste pile fire and discharge of overflow fire effluent on to the Scotia drinking water intake infiltration galleries. As a result the system failed to maintain at least 0.2 ppm disinfection residual.	7/3/15-7/4/15, 7/7/15- 7/17/15, 7/19/15-7/22/15, 7/27/15	The disruption to the water system was identified and corrective actions were implemented. Chlorine dosage was increased as needed to meet minimum residual requirements. Storage and treatment tanks were cleaned. Filtration systems were reconstituted. Distribution systems were reconfigured and repeatedly flushed.	Inadequately treated water may contain disease-causing organisms. These organisms include bacteria, viruses, and parasites that can cause symptoms such as nausea, cramps, diarrhea, and associated headaches.			

The water treatment system consists of the following processes:

Sedimentation—raw water storage tank Coagulation—coagulant addition and rapid mix Filtration— two pressure filters with sand and gravel media Disinfection—gas chlorination

Our staff of certified operators have kept the drinking waters of Scotia safe and reliable for many years.

# Summary Information for Operating Under a Variance or Exemption
